Nexford University **AI Disclosure Form** | MODULE ASSESSMENTS

Learner Name Mr. Abdi Farah Ahmed

1. **Did you use any AI tool(s) to assist with this assignment?**

   ○ **No.** Why not?

   ◉ **Yes.** List the AI tool(s) you used and briefly describe the purpose for which you used the tool(s). *(e.g., brainstorming, research, drafting content)*

   I used open ChatGPT to help me plan, draft, organise and edit my Module 2 assignment. I used it to organise the report, refine the healthcare no-show problem, organise the RCA, technical architecture, Agile plan, RAID log, and privacy, fairness, and XAI sections, and improve the clarity. I did not copy and paste course content into ChatGPT. I independently checked, edited, and verified all AI-supported material before including it.

2. **To demonstrate effective AI use, please provide your initial prompt(s) and a brief description of the steps you took to refine and iterate on the AI's output for this**

   My first prompt was: "Help me structure a healthcare no-show analytics project with predictive and prescriptive analytics." Then I enhanced my prompts for measurable KPIs, 5 Whys and Fishbone analysis, technical architecture, Agile sprints, RAID controls, privacy, fairness and explainability. ChatGPT was helpful for organising ideas and suggesting alternative approaches, but some outputs were generic, assumed a U.S. healthcare context, or may risk presenting hypotheses as established causes. I addressed these shortcomings by using the Kaggle dataset as a proxy for development only, adapting the workflow to JJUSHYCSH, applying Ethiopia's privacy framework, separating hypotheses from verified evidence and ensuring risk scores trigger more outreach, not less access. I checked important claims with good sources, rewrote the material in my style and was responsible for all final decisions and content.

3. **List at least one source you consulted to verify the AI-generated content in your work.**

   I validated privacy requirements against Ethiopia's Personal Data Protection Proclamation No. 1321/2024, the proxy dataset against Hoppen's Medical Appointment No Shows dataset, fairness using Fairlearn guidance, and Agile practices using the Scrum Guide. These sources helped verify legal, dataset, fairness and project management claims
